Description

The F1478 is a high gain, two-stage RF Amplifier designed to operate within the 1.8GHz to 5.0GHz frequency range. Using a single 5V power supply and only 140mA of I_{CC}, the F1478 provides 30.3dB of Gain and 1.6dB of Noise Figure with up to +35.73dBm OIP3 and 23.6dBm OP1dB at 3.55GHz.

The F1478 is packaged in a 3 × 3 mm, 16-VFQFPN, with matched 50Ω input and output impedances for ease of integration into the signal path.

Competitive Advantage

- Combines a two-stage RF amplifier in a single, compact 3mm × 3mm VFQFPN package
- Excellent performance over exceptionally wide bandwidths
- Single device provides adjustable linearity versus current via an external resistor

Typical Applications

- 4G / 5G Cellular Basestations
- Multi-mode, Multi-carrier Transmitters
- Active Antenna Systems

Features

- RF range: 1.8GHz to 5.0GHz
- 30.3dB typical gain at 3.55GHz
- 1.6dB NF at 3.55GHz
- Adjustable OIP3 performance
  - +35.7dBm OIP3 at 3.55GHz and 140mA of bias current
  - +32.2dBm OIP3 at 3.55GHz and 100mA of bias current
- Adjustable OP1dB performance
  - +23.6dBm OP1dB at 3.55GHz and 140mA of bias current
  - +22.8dBm OP1dB at 3.55GHz and 100mA of bias current
- 5V power supply
- Adjustable I_{CC} ranging from 80mA to 160mA
- 50Ω Single-ended Input and Output Impedances
- 1.8V Logic Compatible Standby Mode for Power Savings
- Operating temperature (T_{EPAD}) range: -40°C to +115°C
- 3 × 3 mm 16-VFQFPN package

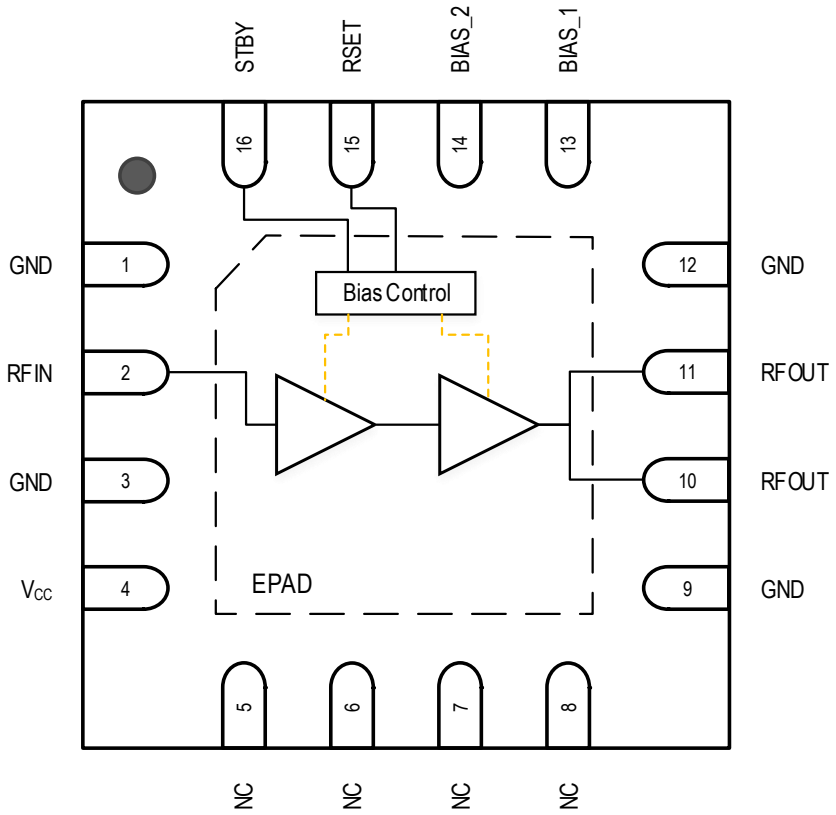
Pin Assignments

Figure 2. Pin Assignments for 3 × 3 × 0.9 mm VFQFPN Package – Top View



Pin Descriptions

Table 1. Pin Descriptions

Number	Name	Description
1, 3, 9, 12	GND	Internally grounded. This pin must be grounded with a via as close to the pin as possible.
2	RFIN	RF input internally matched to 50Ω. Must use an external DC block.
4	V_{CC}-RF	Pull up to V_{cc} through inductor and use bypass capacitors as close to the pin as possible. In addition to supplying the device with a DC voltage, there is also an RF signal present.
5-8	NC	No internal connection. These pins can be left unconnected, or be connected to ground (recommended). Use a via as close to the pin as possible if grounded.
10, 11	RFOUT	RF output. Pull up to V_{cc} through inductor. Must use external DC block.
13	BIAS_1	Connect via resistor to a common V_{cc} and use bypass capacitors as shown in the Typical Application Circuit. Place network as close to the pin as possible.
14	BIAS_2	Connect via inductor to ground.
15	RSET	Connect via resistor to ground. Resistor value sets the device into its low or high power mode.
16	STBY	Standby pin. With Logic LOW applied to this pin the amplifier is powered off. With Logic HIGH applied to this pin (or if the pin is left unconnected), the part is in full operation mode. Pin is 1.8V logic compatible.
	— EPAD	Exposed Pad. Internally connected to ground. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple ground vias are also required to achieve the noted RF performance.

Absolute Maximum Ratings

Stresses above those listed below may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 2. Absolute Maximum Ratings

Parameter	Symbol	Minimum	Maximum	Units
V_{CC} to GND	V_{CC}	-0.3	+6.0	V
STBY	V_{CTL}	-0.3	Lower of (5.0, V_{CC} + 0.25)	V
BIAS_1 (into pin)	I_{BIAS_1}		20	mA
BIAS_2 (out of pin)	I_{BIAS_2}		10	mA
RFIN externally applied DC voltage	V_{RFIN}	-0.5	+0.5	V
RFOUT externally applied DC voltage	V_{RFOUT}	-0.5	+5.5	V
Maximum CW Input Power applied for 24 hours. V_{CC} = 5V, T_{EPAD} = 115˚C, input / output VSWR < 2:1 based on a 50Ω system. Standby = logic HIGH: ON state. [a]	$P_{MAX\_IN\_ON}$		21	dBm
Maximum CW Input Power applied for 24 hour. V_{CC} = 5V, T_{EPAD} = 115˚C, input / output VSWR < 2:1 based on a 50Ω system. Standby = logic LOW: OFF state.[a]	$P_{MAX\_IN\_OFF}$		21	
Continuous Power Dissipation	P_{DISS}		1.8	W
Storage Temperature Range	T_{st}	-65	150	°C
Lead Temperature (soldering, 10s)			260	°C
ElectroStatic Discharge – HBM (JEDEC/ESDA JS-001-2012)	V_{ESDHBM}		500 (Class 1B)	V
ElectroStatic Discharge – CDM (JEDEC 22-C101F)	V_{ESDCDM}		1000 (Class C3)	V

[a] Exposure to these maximum RF levels can result in significantly higher I_{cc} current draw due to overdriving the amplifier stages.

Recommended Operating Conditions

Table 3. Recommended Operating Conditions

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Power Supply Voltage	V_{CC}		3.15		5.25	V
Operating Temperature Range	T_{EPAD}	Exposed Paddle	-40		+115	°C
Junction Temperature – Amplifier	T_j				150	°C
RF Frequency Range [a]	f_{RF}	Band 2p0 Tuning Set	1.8		2.2	GHz
		Band 2p5 Tuning Set	2.3		2.7	
		Band 3p5 Tuning Set	3.3		3.8	
		Band 4p7 Tuning Set	4.4		5.0	
RFIN Port Impedance	Z_{RFI}	Single Ended		50		Ω
RFOUT Port Impedance	Z_{RFO}	Single Ended		50		Ω

[a] Using external matching, gain flatness is optimized from 1.8GHz to 2.2GHz (Band 2p0 Tuning Set), 2.3GHz to 2.7GHz (Band 2p5H Tuning Set), 3.3GHz to 3.8GHz (Band 3p5 Tuning Set), and 4.4GHz to 5.0GHz (Band 4p7 Tuning Set).

Electrical Characteristics – General

See Typical Application Circuit. Specifications apply when operated as a TX amplifier with tuning optimized for desired band of interest, V_{CC} = +5.0V, T_{EPAD} = +25°C, STBY = HIGH, Z_S = Z_L = 50Ω, Evaluation Kit trace and connector losses are de-embedded, unless otherwise stated.

Table 4. Electrical Characteristics

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Logic Input High	V_{IH}		***1.17*** [a]		***V_{CC}***	V
Logic Input Low	V_{IL}		***-0.3***		***0.63***	V
Logic Current	I_{STBY}	STBY	***-10***		***+10***	µA
Quiescent Current [b]	I_{CC_QL}	Low Power Mode: R3 = 16kΩ		100	130	mA
	I_{CC_QH}	High Power Mode: R3 = 10kΩ		140	178	
Standby Current	I_{CC_STBY}	STBY = LOW		1.5		mA
Standby Switching Time	t_{ON}	50% STBY control to within 0.5dB of the on-state final gain value		270		ns
	t_{OFF}	50% STBY control to 30dBc below nominal gain value		60		

[a] Specifications in the minimum/maximum columns that are shown in ***bold italics*** are guaranteed by test. Specifications in these columns that are not shown in bold italics are guaranteed by design characterization.

[b] I_{CC} refers to the nominal small signal bias current.

Thermal Characteristics

Table 13. Package Thermal Characteristics

Parameter	Symbol	Value	Units
Junction to Ambient Thermal Resistance	θ_{JA}	67.9	°C/W
Junction to Case Thermal Resistance. (Case is defined as the exposed paddle)	θ_{JC_BOT}	22.9	°C/W
Moisture Sensitivity Rating (Per J-STD-020)		MSL 3	

Typical Operating Conditions

Unless otherwise stated the typical operating graphs were measured under the following conditions:

- V_{cc} = 5.0V
- $Z_S = Z_L$ = 50Ω Single Ended
- I_{CC} = 100mA or 140mA
- f_{RF} = 2.0GHz (Band 2p0)
- f_{RF} = 2.5GHz (Band 2p5)
- f_{RF} = 3.55GHz (Band 3p5)
- f_{RF} = 4.7GHz (Band 4p7)
- T_{EPAD} = +25°C
- STBY = HIGH
- 1MHz Tone Spacing
- All temperatures are referenced to the exposed paddle

Standby

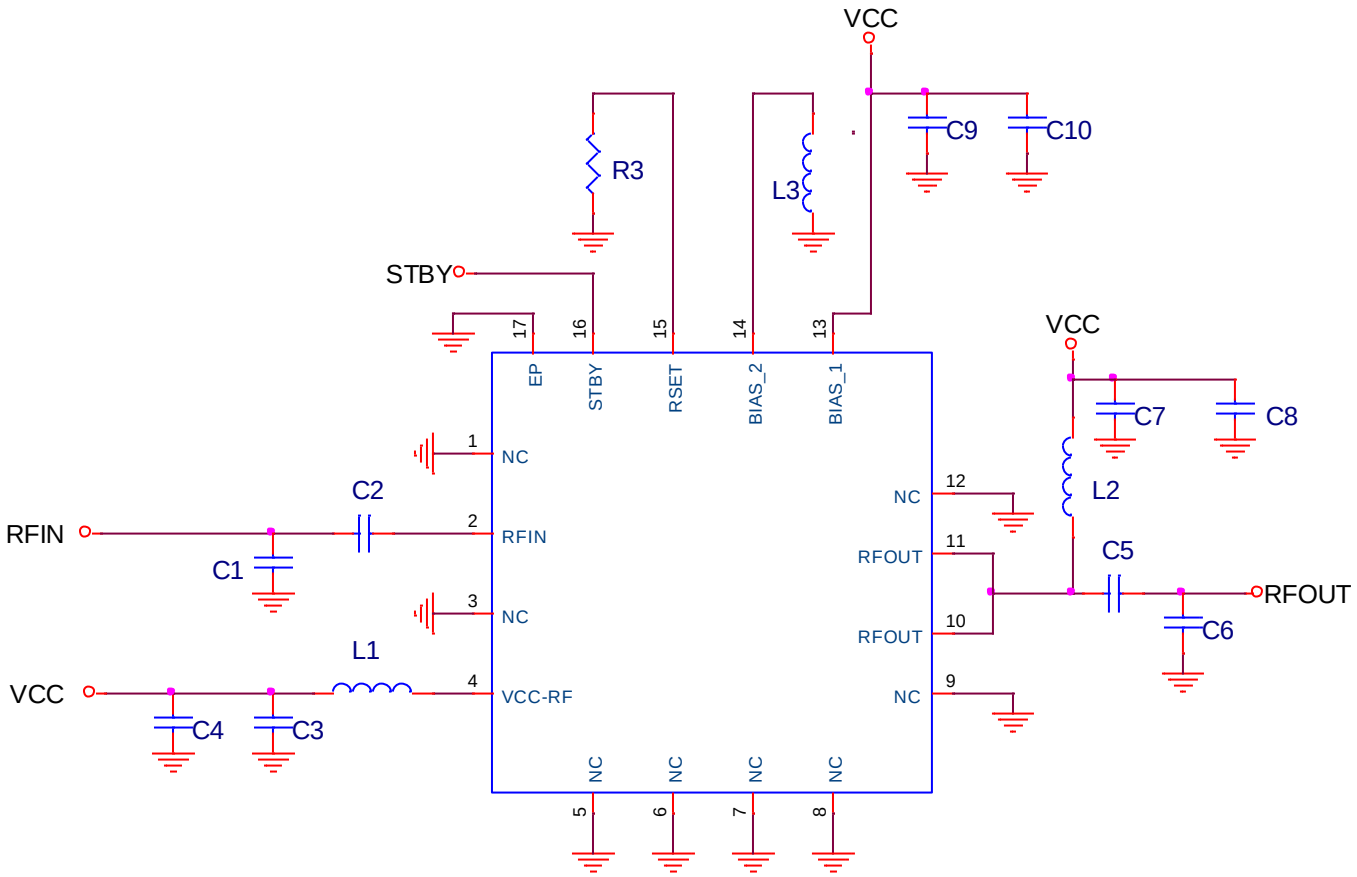
The F1478 can be turned off for low current consumption. This is done by applying a logic voltage to pin 16 using Table 14.

Table 14. Standby Truth Table

STBY	Condition
Logic HIGH	Full operation
Logic LOW	Amplifier OFF

Typical Application Circuit

Figure 99. Typical Application Circuit



Note 1: All external components are size 0402 *except* C4, C8, and C10. These three capacitors are 0603 components as per the layout shown in Figure 100. Although these capacitors are sized as 0603 on the EVKit, comparable 0402 devices can be used instead.

Note 2: For the 3.3 to 3.8GHz and 4.4 to 5.0GHz bands of operation, the optimal input tuning topology uses a SHUNT INDUCTOR for C1. If there is a DC bias associated with the RF output from a preceding stage, then an additional DC block should be used to prevent a DC short through the shunt inductor placed at C1.

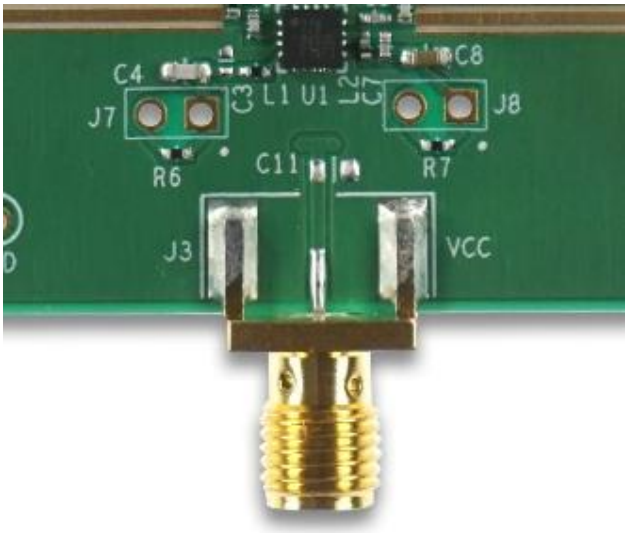
Evaluation Kit Operation

Power Supply Setup

Set up a power supply in the voltage range of 3.0V to 5.5V, preferably around 5.0V, with the power supply output disabled. Apply the voltage through the J3 connector as shown in Figure 103.

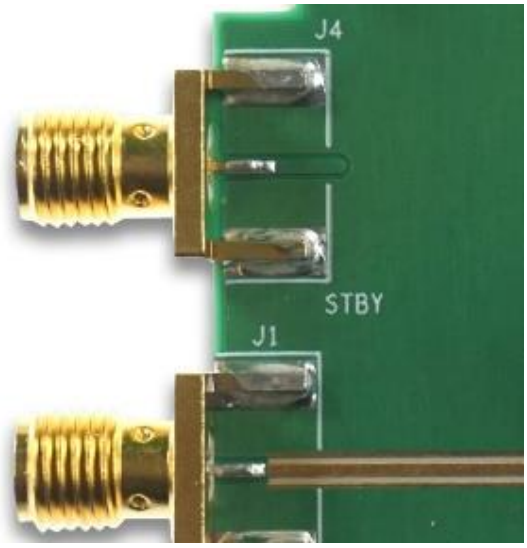
Figure 103. Power Supply Connections



Standby

Set up a power supply in the voltage range of 1.5V to 5.5V with the power supply output disabled. Apply the voltage through the J4 connector as shown in Figure 104.

Figure 104. Standby Connection



Power-On Procedure

Set up the voltage supplies and Evaluation Board as described in Power Supply Setup

1. Enable the power supply
2. Turn on the power supply

Power-Off Procedure

1. Turn off the power supply
2. Disable the power supply

Application Information

The F1478 has been optimized for use in high performance RF applications ranging from 1.8GHz to 5.0GHz. Separate, broadband tuning options are recommended for operating the device within four sub-bands, specifically 1.8GHz to 2.2GHz (Band 2p0), 2.3GHz to 2.7GHz (Band 2p5), 3.3GHz to 3.8GHz (Band 3p5), and 4.4GHz to 5.0GHz (Band 4p7).

Performance

The high performance is obtained by tuning the F1478 for the input match (RFIN, pin 2), output match (RFOUT, pins 10 and 11), and the interstage V_{CC} (pin 4). RSET (pin 15) is used to set the overall current of the amplifier by setting a resistor to ground. The current will affect all of the amplifier parameters. Bias 2 (pin 13), Bias 1 (pin 14) will mainly affect the intermodulation parameters.

When designing a layout keep the components as close to the package as possible. Use the application circuit shown in Figure 99 and the best RF practices to achieve optimum performance.

Standby Mode (STBY)

The F1478 uses a power down feature for power savings. Connecting pin 16 to a logic HIGH (or leaving the pin unconnected) enables the device. With a logic LOW applied to pin 16, the amplifier is placed in standby mode. The Standby mode is a high isolation state. The level of this isolation is not specified and is dependent on the device.

Digital Pin Voltage and Resistance Values

Table 16 provides the open-circuit DC voltage referenced to ground and resistance values for each of the control pins listed.

Table 16. Digital Pin Voltages and Resistance

Pin	Name	Open Circuit DC Voltage	Internal Connection
16	STBY	V_{CC}	100kΩ pull-up resistor to V_{CC}

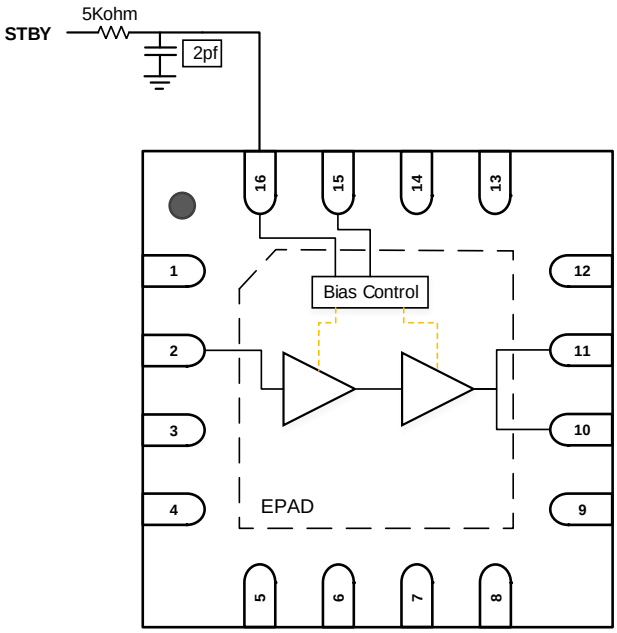
© 2019 Renesas Electronics Corporation

Power Supplies

A common V_{CC} power supply should be used for all power supply pins. To minimize noise and fast transients, add de-coupling capacitors to all supply pins. Supply noise can degrade noise figure and fast transients can trigger ESD clamps causing them to fail. Supply voltage change or transients should have a slew rate smaller than 1V / 20µs. In addition, all control pins should remain at 0V (±0.3V) while the supply voltage ramps or while it returns to zero.

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit is recommended at the input of each control pin. This applies to the standby pin (16) as shown below. Note the recommended resistor and capacitor values do not necessarily match the EVKit BOM for the case of poor control signal integrity. For multiple devices driven by a single control line, the component values will need to be adjusted accordingly so as not to load down the control line.

Figure 105. Control Pin Interface for Signal Integrity



Package Outline Drawings

The package outline drawings are appended at the end of this document and are accessible from the link below. The package information is the most current data available.
