### 1.2 Pin Descriptions

Pin	Name	Function
1	V <sub>CTL</sub>	Logic control pin. See Table 3 for logic control states.
2	RFC	RF common port. Matched to 50Ω in the insertion loss state only. If this pin is not 0V DC, then an external coupling capacitor must be used.
3	V <sub>cc</sub>	Power supply. Bypass to GND with capacitors as close as possible to the pin.
4	RF2	RF2 port. Matched to 50Ω in the insertion loss state only. If this pin is not 0V DC, then an external coupling capacitor must be used.
5	GND	Ground. Ground this pin as close to the device as possible.
6	RF1	RF1 port. Matched to 50Ω in the insertion loss state only. If this pin is not 0V DC, then an external coupling capacitor must be used.
-	EP	Exposed pad. Internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple ground vias are also required to achieve the specified RF performance.

## 8. Application Information

### 8.1 Default Start-up

The  $V_{CTL}$  control pin includes no internal pull-down resistors to logic LOW or pull-up resistors to logic HIGH.

### 8.2 Power Supplies

A common  $V_{CC}$  power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate slower than 1V / 20μs. In addition, all control pins should remain at 0V ( $\pm 0.3V$ ) while the supply voltage ramps up or while it returns to zero.

### 8.3 Control Pin Interface

If a clean control signal cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit at the input of the control pin is recommended.
