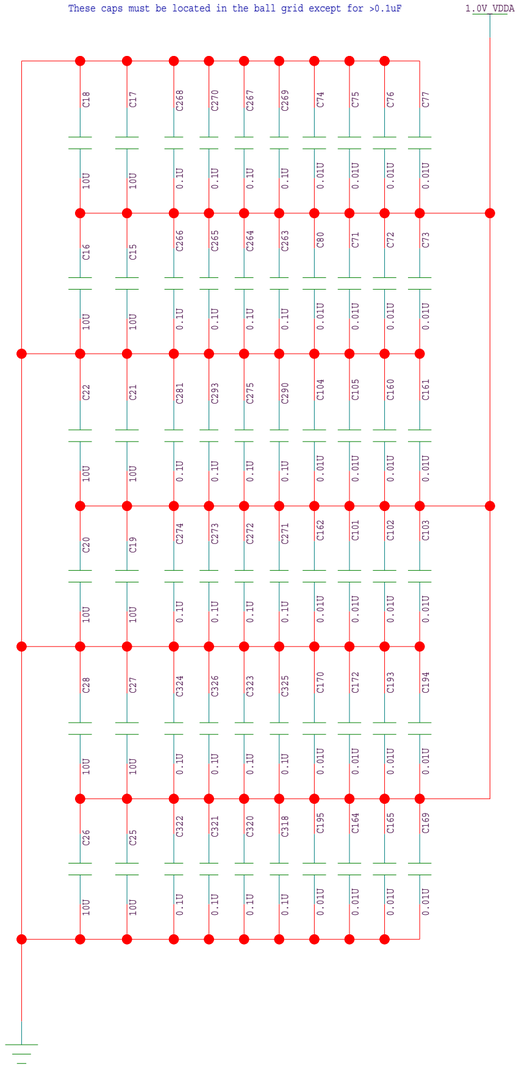
80HCPS1848 Power and Decoupling

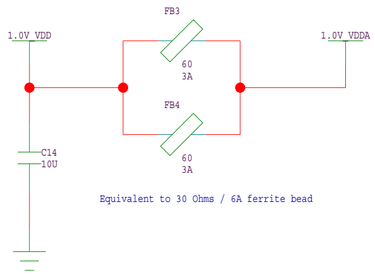
Decoupling 1.0V_VDDA

These caps must be located in the ball grid except for >0.1uF

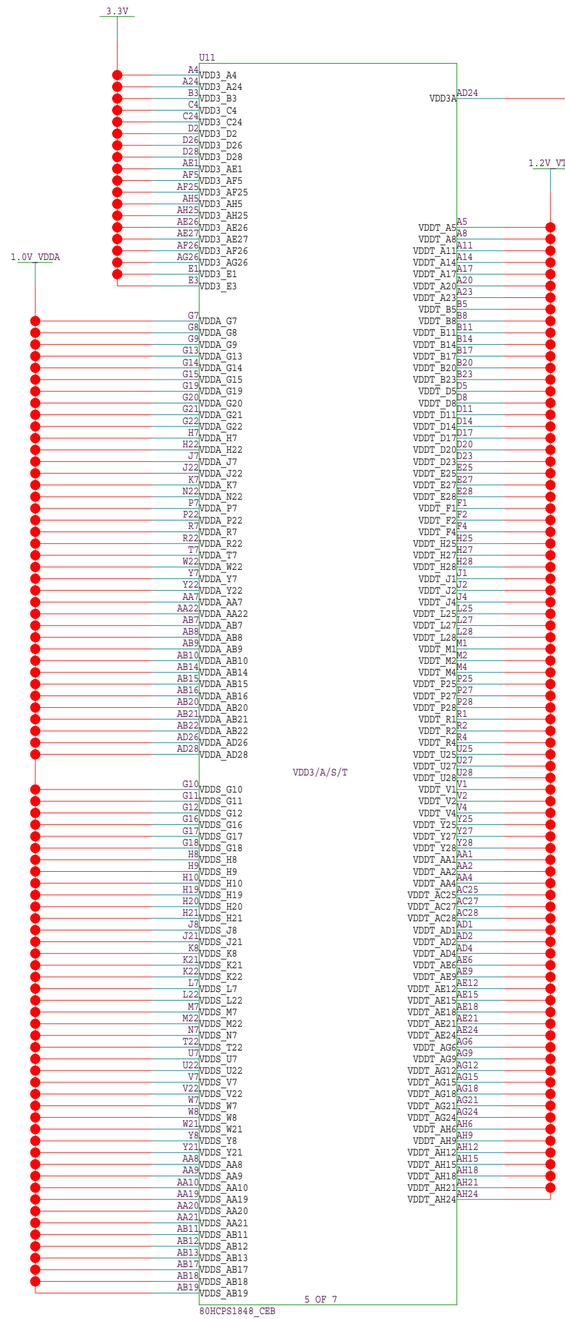


Board layout note:

Make two seperate power planes: 1.0V_VDD and 1.0V_VDDA

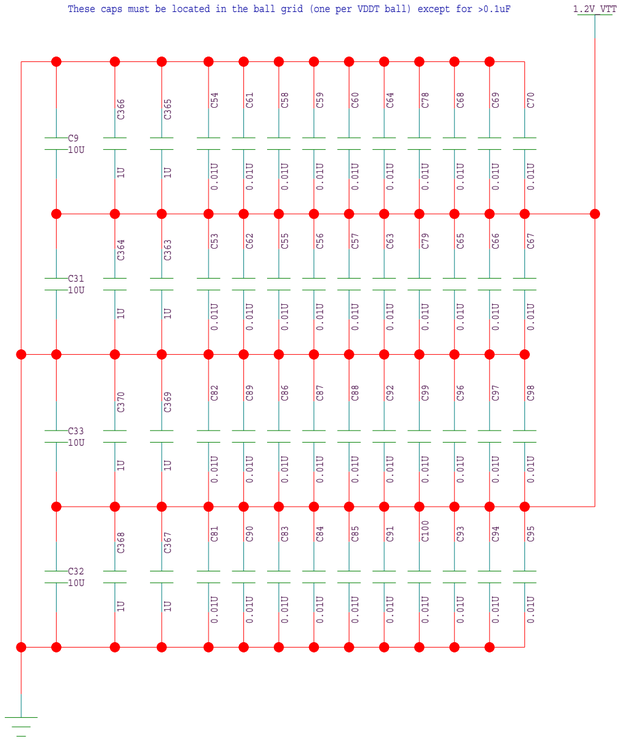


Equivalent to 30 Ohms / 6A ferrite bead



Decoupling 1.2V_VDDT

These caps must be located in the ball grid (one per VDDT ball) except for >0.1uF



Decoupling 3.3V

These caps must be located in the ball grid except for >0.1uF

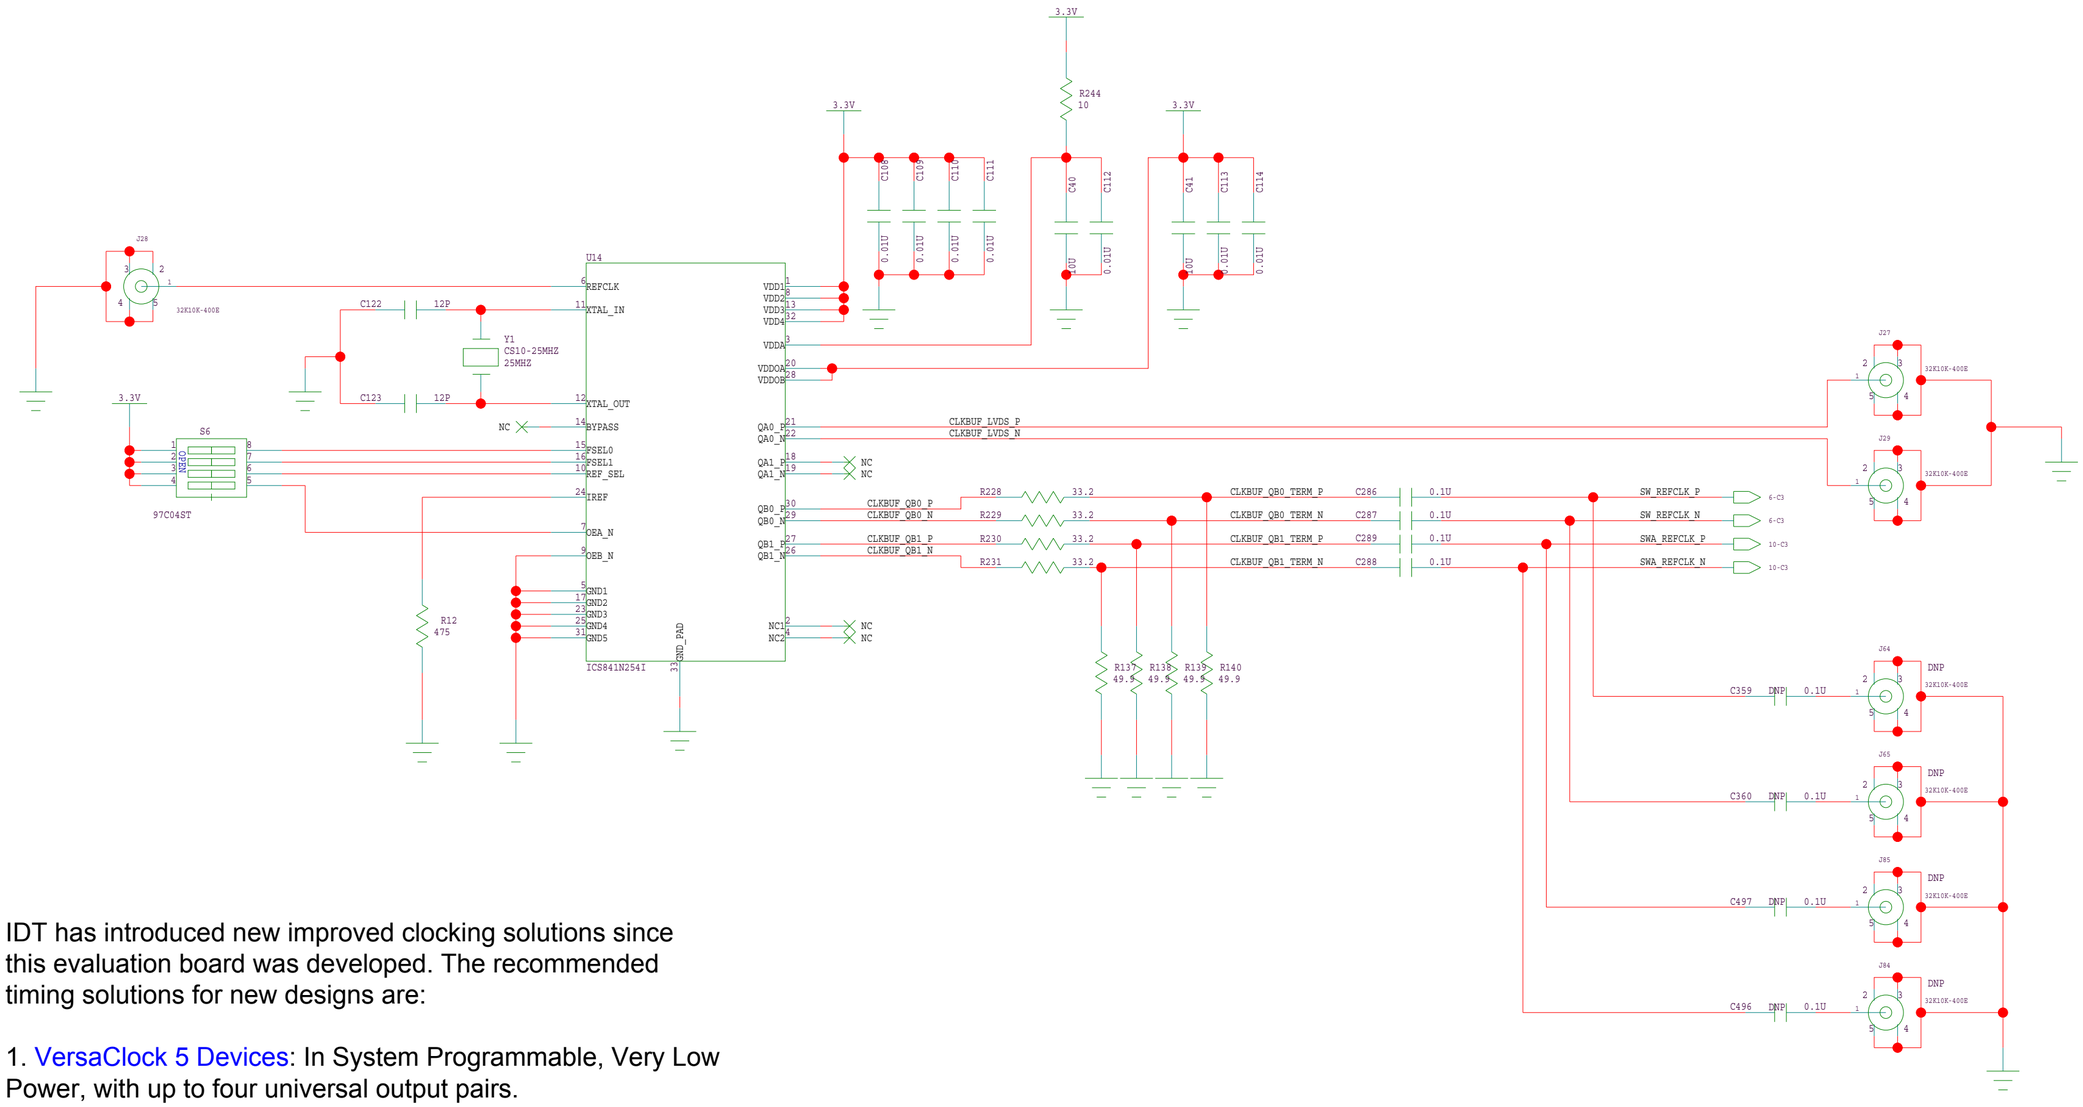
Clocking



IDT has introduced new improved clocking solutions since this evaluation board was developed. The recommended timing solutions for new designs are:

1. VersaClock 5 Devices: In System Programmable, Very Low Power, with up to four universal output pairs.

2. XUM LVDS Crystal Oscillator: Ultra precise with only 300fs typical phase jitter. If using a 156.25 MHz clock source then the applicable part number is XUM535156.250JS6I8.

Voltage Regulators for 80HCPS1848

Following power-up sequence is necessary in order for the device to function properly: The serdes voltage (VDDS) needs to power-up first followed by serdes voltage (VDDT). The voltages on any Input or I/O pins cannot exceed its corresponding supply voltage during power supply ramp up.

Revision History

April 7, 2015 -- Added a note on sheet 21 on improving clocking solutions for S-RIO components.

April 1, 2011 -- Changed FB3/FB4 on sheet 7, and FB6 on sheet 11, to 60 Ohms 3A.

January 26, 2011 -- Added a JTAG TRST implementation note on sheet 22.

September 13, 2010 -- Updated the JTAG Header resistor on sheet 22.

July 26, 2010 -- First release of document.
