

F2934

High Reliability SP2T RF Switch 50MHz to 6000MHz

The F2934 is a high reliability, low insertion loss, 50 Ω SP2T absorptive RF switch designed for a multitude of wireless and other RF applications. This device covers a broad frequency range from 50MHz to 6000MHz. In addition to providing low insertion loss, the F2934 delivers high linearity and high isolation performance while providing a 50 Ω termination to the unused RF input ports.

The F2934 uses a single positive supply voltage of 2.7V to 5.25V supporting three states using either 3.3V or 1.8V control logic.

Competitive Advantage

The F2934 provides the following advantages:

- Constant impedance $K_{|Z|}$ during switching transition
- Insertion Loss = 0.8dB (at 2GHz)
- RFX to RFC Isolation = 73dB (at 2GHz)
- IIP3 = +61dBm (at 2GHz)
- Active Port Operating Power Handling = 34dBm
- Term Port Operating Power Handling = 27dBm

Block Diagram

Figure 1. Block Diagram

Features

- High Isolation:
 - 74dB at 1GHz
 - 73dB at 2GHz
 - 70dB at 3GHz
 - 66dB at 4GHz
- High Linearity:
 - IIP3 of 61dBm at 2GHz
- Wide single 2.75V to 5.25V supply voltage range
- 3.3V and 1.8V compatible control logic
- Operating temperature -40°C to +105°C
- 3 × 3 mm 16-VFQFPN package

Applications

- Base Station 2G, 3G, 4G, 5G
- Portable Wireless
- Repeaters and E911 systems
- Digital Pre-Distortion
- Point to Point Infrastructure
- Public Safety Infrastructure
- WIMAX Receivers and Transmitters
- Military Systems and JTRS radios
- RFID handheld and portable readers
- Test / ATE Equipment

1. Pin Information

1.1 Pin Assignments

1.2 Pin Descriptions

Table 1. Pin Descriptions

Pin Number	Pin Name	Description
1	VCTL	Controls the selected path when EN is low. It is disabled when EN is logic high (see Table 2).
2, 4, 6, 7, 8, 10, 11, 13, 14, 15	GND	Ground. Also, internally connected to the ground paddle. Ground this pin as close to the device as possible.
3	RFC	RF Common Port. Matched to 50Ω when one of the two RF ports is selected. If this pin is not 0V DC then an external coupling capacitor must be used.
5	EN	EN as a logic low allows VCTL to control the selected switch path. With EN set to logic high puts the part in all paths off state and disables the control of VCTL (Table 2).
9	RF1	RF1 Port. Matched to 50Ω. If this pin is not 0V DC, then an external coupling capacitor must be used.
12	RF2	RF2 Port. Matched to 50Ω. If this pin is not 0V DC, then an external coupling capacitor must be used.
16	VDD	Power Supply. Bypass to GND with capacitors shown in the Typical Application Circuit as close as possible to pin.
	EP	Exposed Pad. Internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device and into the PCB ground planes. These multiple ground vias are also required to achieve the specified RF performance.

2. Specifications

2.1 Absolute Maximum Ratings

The absolute maximum ratings are stress ratings only. Stresses greater than those listed below can cause permanent damage to the device. Functional operation of the F2934 at absolute maximum ratings is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Parameter		Symbol	Minimum	Maximum	Unit
VDD to GND		V _{DD}	-0.3	+5.5	V
VCTL, EN to GND		V _{logic}	-0.3	3.6	V
RF1, RF2, RFC to GND		V _{RF}	-0.3	+0.3	V
RF Input Power ^[1]	RF1 or RF2 as an input (Connected to RFC)	P _{RF12}	-	36 ^[2]	dBm
	RFC as an input (Connected to RF1 or RF2)	P _{RFC}	-	36	
	RFC as an input (All off state)	P _{RFC_OFF}	-	30	
	RF1 or RF2 as input (Terminated states)	P _{RF12_TERM}	-	30 ^[2]	
	RF1 and RF2 as inputs (All off state)	P _{RF12_OFF}	-	30 ^[2]	
Maximum Junction Temperature		T _{Jmax}		+125	°C
Storage Temperature Range		T _{ST}	-65	+150	°C
Lead Temperature (soldering, 10s)		T _{LEAD}	-	+260	°C
ESD Voltage – HBM (Per JESD22-A114)		V _{ESDHBM}	-	1000	V
ESD Voltage – CDM (Per JESD22-C101)		V _{ESDCDM}	-	500	V

1. VDD = 2.7V to 5.25V, 250MHz ≤ FRF ≤ 6000MHz, T_c = 105°C, ZS = ZL = 50Ω.
2. Each port.

2.2 Recommended Operating Conditions

Parameter	Symbol	Conditions		Minimum	Typical	Maximum	Unit
Supply Voltage	V _{DD}	-		2.7	-	5.25	V
Operating Temperature Range	T _{CASE}	Exposed Paddle Temperature		-40	-	+105	°C
RF Frequency Range	F _{RF}	-		50	-	6000	MHz
RF Continuous Input CW Power (Non-Switched)	P _{RF}	RFC connected to RF1 or RF2 ^[2]	T _C = 85°C	-	-	34	dBm
			T _C = 105°C	-	-	34	
		RF1/ RF2 Input, Terminated State ^{[3][4]}	T _C = 85°C	-	-	27	
			T _C = 105°C	-	-	27	
		RFC Input, All off State	T _C = 85°C	-	-	27	
			T _C = 105°C	-	-	27	
RF Continuous Input Power (RF Hot Switching CW) ^[1]	P _{RFSW}	RFC Input, switching between RF1 and RF2.	T _C = 85°C	-	-	30	dBm
			T _C = 105°C	-	-	30	
		RFC Input, switching into or out of, All off State.	T _C = 85°C	-	-	27	
			T _C = 105°C	-	-	27	
		RF1 or RF2 as input, switched between RFC and Term.	T _C = 85°C	-	-	27	
			T _C = 105°C	-	-	27	
		RF1 and RF2 as inputs, switching into or out of All off State. ^[4]	T _C = 85°C	-	-	27	
			T _C = 105°C	-	-	27	
RF1/2 Port Impedance	Z _{RFx}	-		-	50	-	Ω
RFC Port Impedance	Z _{RFC}	-		-	50	-	Ω

1. Levels based on: $V_{DD} = 3.1V$ to $5.25V$, $250MHz \leq F_{RF} \leq 6000MHz$, $Z_S = Z_L = 50\Omega$. See Figure 2 for power handling derating vs. RF frequency.
2. Input could be RFC, RF1, or RF2 (applied to only one input).
3. Any RF1 / RF2 termination state. Power level specified is for each port.
4. Power level specified is for each port.

Figure 2. Maximum RF Input Operating Power vs. Frequency

2.3 Thermal Information

Symbol	Parameter	Value	Units
Θ_{JA}	Theta JA. Junction to ambient.	46.3	°C/W
Θ_{JC}	Theta JC. Junction to case. The case is defined as the exposed paddle.	1.5	°C/W
MSL	Moisture Sensitivity Rating (Per J-STD-020)	MSL1	-

2.4 Electrical Specifications

Typical Application Circuit, $V_{DD} = 5.0V$, $T_C = +25^\circ C$, $F_{RF} = 2000MHz$, Driven Port = RF1, RF2, input power = 10dBm, $Z_S = Z_L = 50\Omega$, PCB board trace and connector losses are de-embedded unless otherwise noted.

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Logic Input High Threshold	V_{IH}	-	1.1	-	3.6	V
Logic Input Low Threshold	V_{IL}	-	-0.3	-	0.6	V
Logic Current	I_{IH}, I_{IL}	For each control pin	-1	-	+1	μA
DC Current	I_{DD}	$V_{DD} = 3.3 V$	-	205	400 [1]	μA
		$V_{DD} = 5.0 V$	-	250	450

				4GHz	-	61.5	

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Non-RF Driven Spurious ^[4]	Spur _{MAX}	At any RF port when externally terminated to 50Ω (RBW = 100Hz)	-	-114	-	dBm
Switching Time ^[5]	T _{SW}	50% control to 90% RF	-	325	-	ns
		50% control to 10% RF	-	255	-	
Maximum Switching Rate ^[6]		-	-	25	-	kHz

- Items in minimum/maximum columns in ***bold italics*** are confirmed by Test.
- Items in minimum/maximum columns that are not bold/italics are confirmed by Design Characterization.
- The input 0.1dB compression point is a linearity figure of merit. For the maximum operating power levels, see Recommended Operating Conditions.
- Spurious due to on-chip negative voltage generator. Typical generator fundamental frequency is 5.2MHz.
- F_{RF} = 2GHz.
- Minimum time required between switching of states = 1 / Maximum Switching Rate.

3. Control Mode

Table 2. Switch Control Truth Table

VCTL	EN	RFC to RF1	RFC to RF2
0	0	OFF	ON
1	0	ON	OFF
0	1	OFF	OFF
1	1	OFF	OFF

4. Typical Performance Graphs

Unless otherwise noted for the typical performance graphs on the following pages, the following conditions apply:

- V_{DD} = 5V
- T_C = +25°C (T_C = Temperature of Exposed Paddle)
- F_{RF} = 2000MHz
- Z_S = Z_L = 50Ω
- P_{IN} = 0 dBm for all small signal tests.
- P_{IN} = +15 dBm/tone applied to RF1 or RF2 port for two tone linearity tests.
- Two-tone frequency spacing = 1MHz.
- RF1 or RF2 is the driven RF port and RFC is the output port.
- All unused RF ports terminated into 50Ω.
- For Insertion Loss and Isolation plots, RF trace and connector losses are de-embedded.
- Plots for Isolation and Insertion Loss over temperature and voltage are for a typical path. For performance of a specific path, refer to the online S-Parameter file.

5. Application Information

5.1 Default Start-up

There are no internal pull-up or pull-down resistors on the VCTL or EN pins.

5.2 Logic Control

Control pins VCTL and EN are used to set the state of the SP2T switch (see Table 2).

5.3 Power Supplies

A common V_{DD} power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than $1V / 20\mu s$. In addition, all control pins should remain at 0V ($\pm 0.3V$) while the supply voltage ramps or while it returns to zero.

5.4 Control Pin Interface

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit at the input of each control pin is recommended. This applies to control pin 1 (VCTL) and pin 5 (EN) as shown below.

Figure 18. Typical Application Circuit

6. Evaluation Board

6.1 Board Images

Figure 19. Evaluation Board – Top View

Figure 20. Evaluation Board – Bottom View

6.2 Setup and Configuration

6.2.1. External Supply Setup

Set up a VCC power supply in the voltage range of 2.7V to 5.25V and disable the power supply output.

6.2.2. Logic Control Setup

Using the evaluation board to manually set the control logic:

On connector J6 connect a 2-pin shunt from pin 3 (VCC) to pin 4 (V_{LOGIC}). This connection provides the VCC voltage supply to the Eval Board logic control pull up network. Resistors R5 and R6 form a voltage divider to set the V_{high} level over the 2.7V to 5.25V V_{CC} range for manual logic control.

Connector J6 has 2 logic input pins: EN (pin 5) and V_{CTL} (pin 7). See Table 2 for Logic Truth Table. With the pull-up network enabled (as noted above) these pins can be left open to provide a logic high through pull-up resistors R3 and R4. To set a logic low for EN and V_{CTL} connect 2-pin shunts on J6 from pin 5 (EN) to pin 6 (GND) and from pin 7 (V_{CTL}) to pin 8 (GND).

Note that when using the on board R5 / R6 voltage divider the current draw from the V_{CC} supply will be higher by approximately $V_{CC} / 37k\Omega$.

Using external control logic:

External logic controls are applied to J6 pin 5 (EN) and pin 7 (V_{CTL}). See Table 2 for Logic Truth Table.

6.2.3. Turn On Procedure

Setup the supplies and Evaluation Board as noted in the **External Supply Setup** and **Logic Control Setup** sections above.

Connect the preset disabled V_{CC} power supply to the red V_{CC} loop and ground to GND1 or GND2.

Enable the V_{CC} supply.

Set the desired logic setting using J6 pin 5 (EN) and pin 7 (V_{CTL}) to achieve the desired Table 2 setting. Note that external control logic should not be applied without V_{CC} being present.

6.2.4. Turn Off Procedure

If using external control logic for EN and V_{CTL} then set them to a logic low.

Disable the V_{CC} supply.

6.3 Application Circuit

- 1) RC networks on logic lines are for dampening.
- 2) Use 0402 package for decoupling caps close to DUT.
Use 0603 for caps further from DUT
- 3) RF Traces from RF1, RF2, RFC must be the same length.
